## Login Flow Re-Design

Click [this link](#) to view these notes in German.

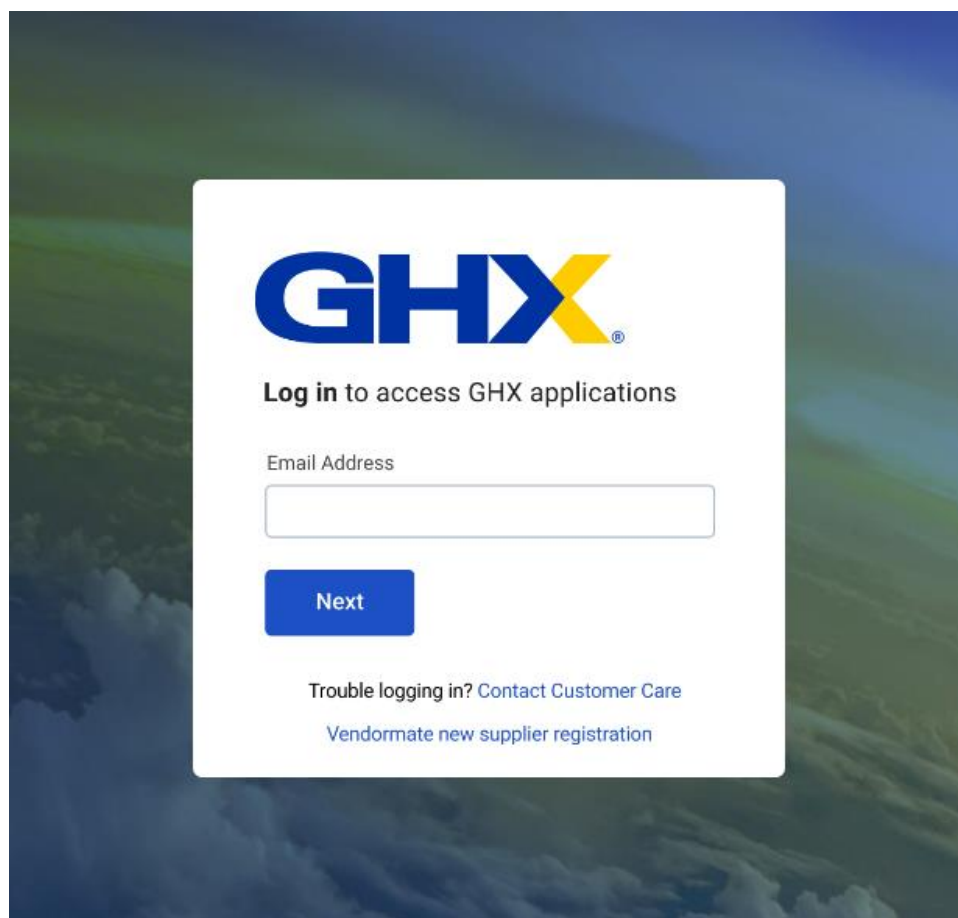

### Problem

Changes to the GHX Single Sign On portal login flow process are needed to support future GHX functionality.

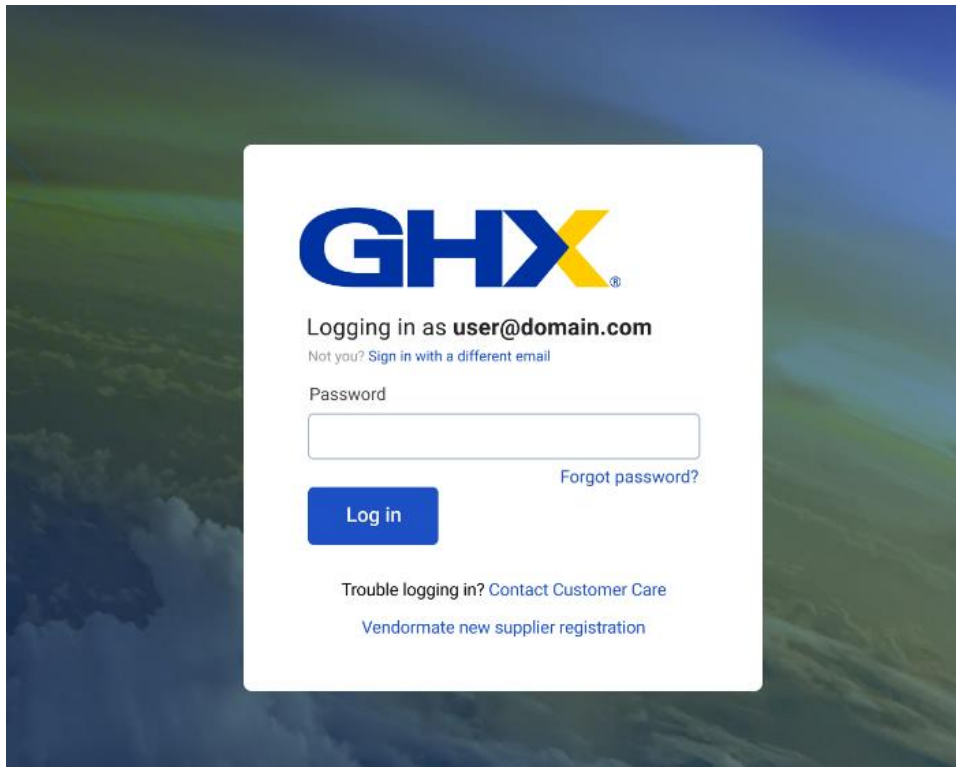

### Solution

GHX is updating the workflow and design of the GHX Single Sign On portal login screens for [login.ghx.com](#) and [my.ghx.com](#). As of August 15, 2022, users will enter their email address on the first screen, and their password on the second screen.

This is an example of the first login screen.

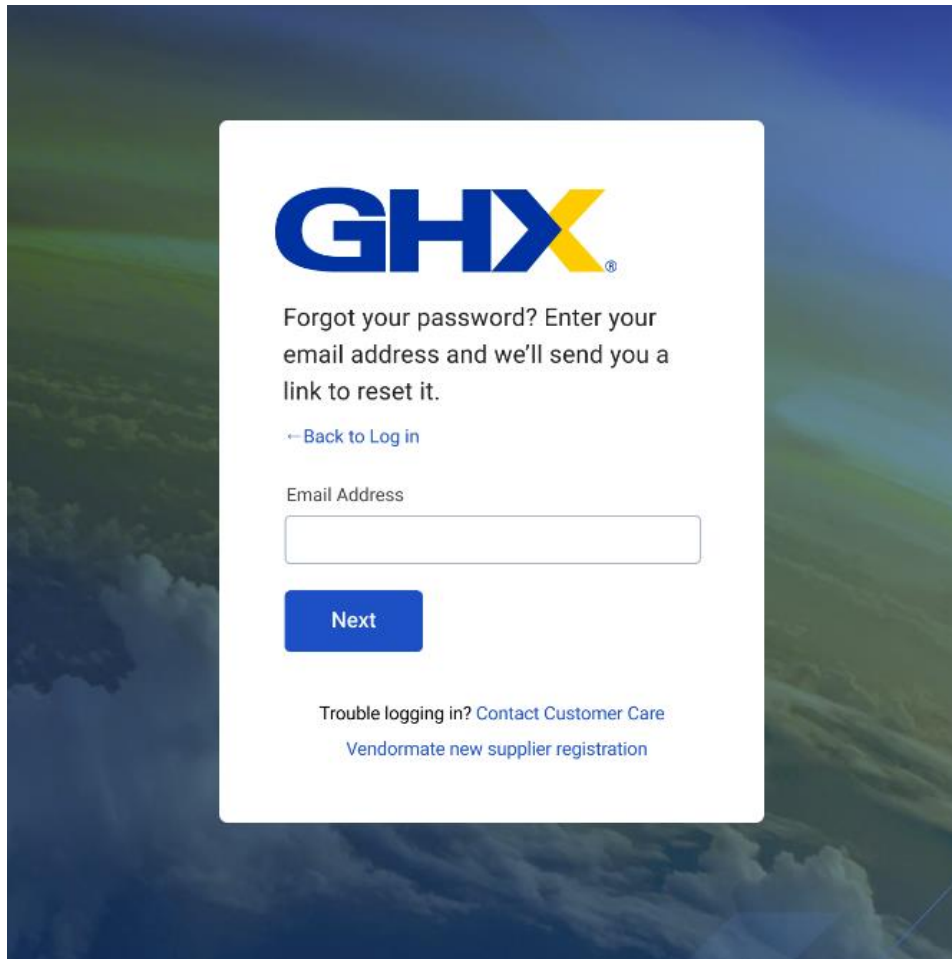

This is an example of the second login screen.

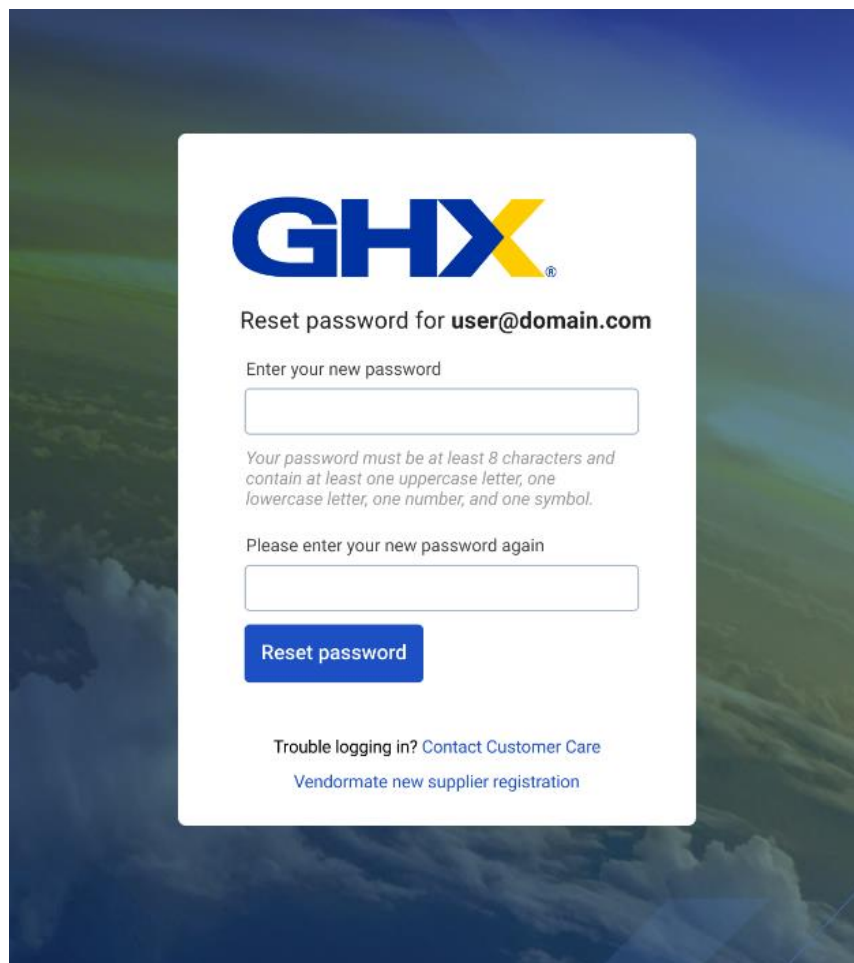

Password reset functionality will also utilize the new design.

This is an example of the first password reset screen.

This is an example of the second password reset screen.

## Impact/Action

Starting August 15, 2022, all users who log in to the GHX Single Sign On portal will see an updated design for login entry and password reset flows.

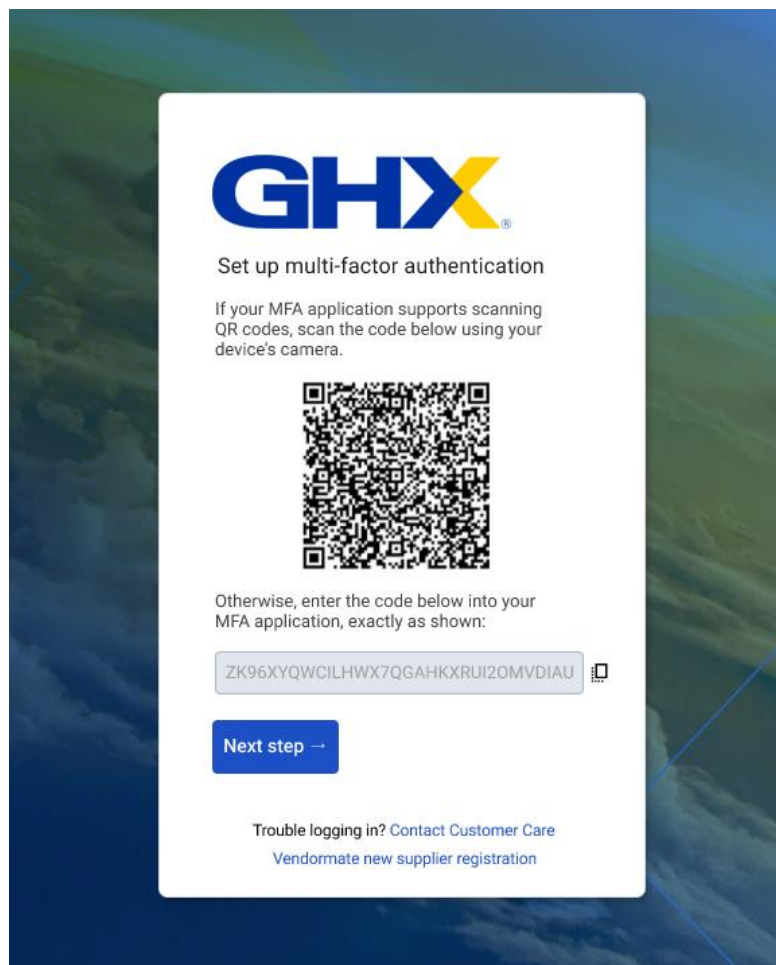

## Multi-Factor Authentication

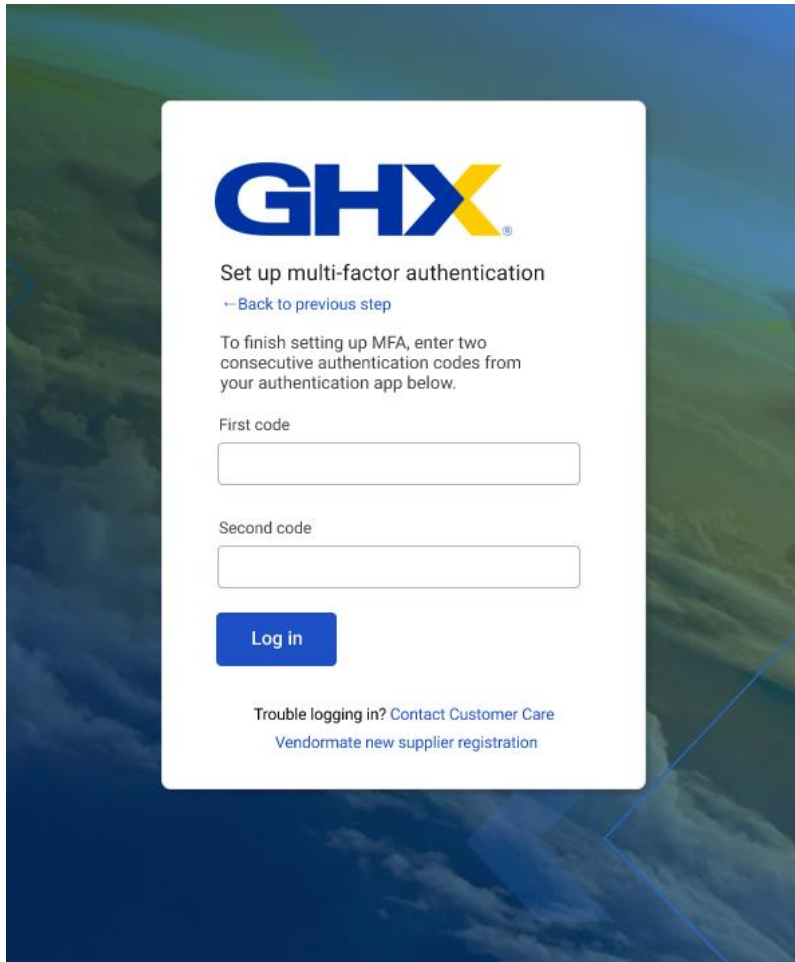

### Problem

Some organizations require enhanced security when users access GHX applications and some organizations wish to offer enhanced security as an available option for their users.

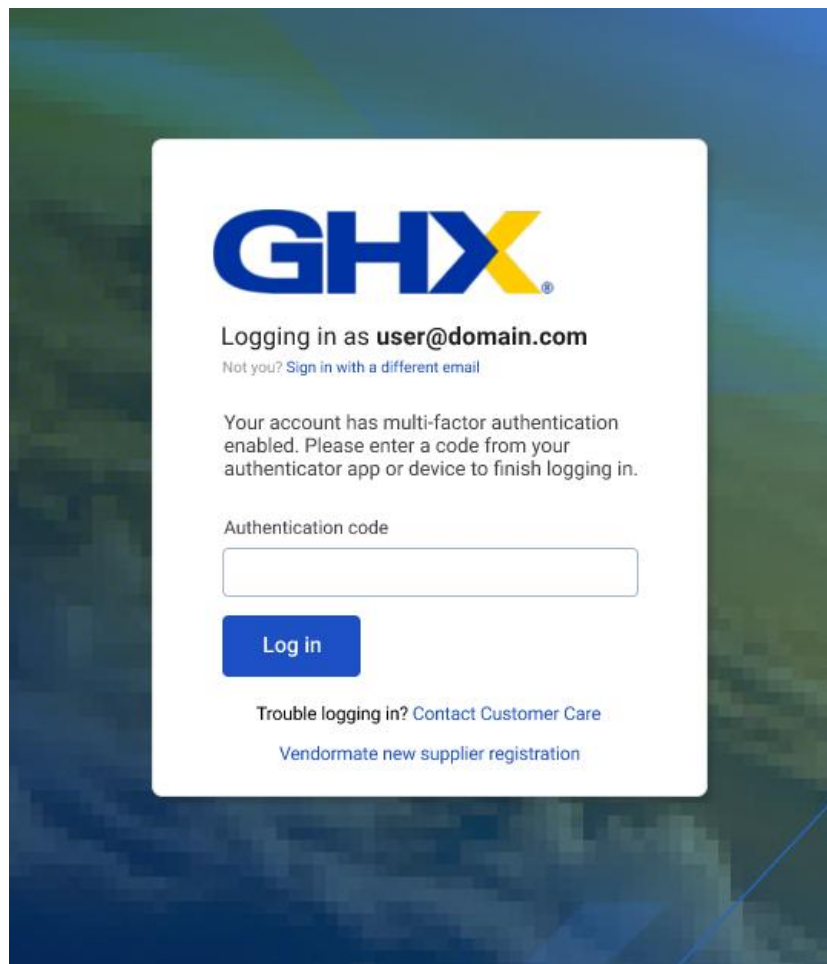

### Solution

GHX offers multi-factor authentication as an optional organization and user preference. Note that there are some organizations that require this for their users as opposed to it being optional. Examples of three of the multi-factor authentication login screens follow.

For details about how to set up and configure multi-factor authentication for users, see this User Management help topic: [Multi-Factor Authentication](#).

## Impact/Action

If your organization wants to make multi-factor authentication a required configuration (as opposed to optional) for your users, contact GHX [Customer Care](#) to request they enable this functionality.
